4G LTE Failover

**Network outages are going to happen,
do you have a backup plan?**

4G LTE Failover

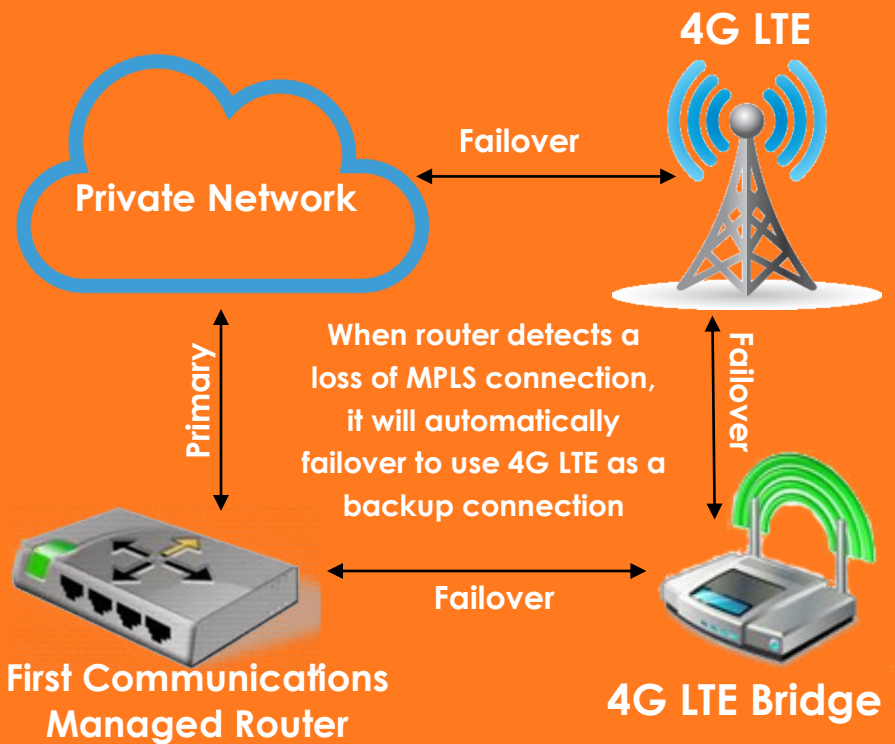

Whether it is weather related or outdated copper networks, your wide area network will have outages. Traditional enterprises have used various WAN backup solutions such as analog lines, but First Communications is now offering a 4G LTE wireless failover plan. Utilizing Cradlepoint technologies, your outage will make a seamless transition to our LTE backup.

Features

- ✓ At time of failure, automatic roll over to the 4G LTE system
- ✓ Stay connected to your data networks when wired connections are unavailable
- ✓ Simple, scalable, and easy to deploy
- ✓ Remote management and monitoring

How It Works

Our 4G LTE Failover product is a premises-based solution that uses routing intelligence between the primary connectivity router and the cellular-based failover device. This routing intelligence allows the device to detect when the primary connection is no longer working and automatically re-route pre-defined critical business traffic to the 4G LTE connection. Likewise, when the device detects that the primary connection is restored, traffic is routed back, automatically.

- ✓ **Protect:** Eliminate downtime and Save money by keeping employees productive
- ✓ **Reliable:** Using 4G LTE wireless network and Cradlepoint technologies, your mission critical business applications will be operating
- ✓ **Continuity:** Continue servicing customers and generating revenue
- ✓ **Cost Effective:** Designed to support the “must have” applications to keep your system operational
